PROFILE

Solidity Smart Contract Developer and Geophysics graduate with hands-on experience designing, testing, and deploying Ethereum smart contracts and full-stack Web3 applications. Experienced with Solidity, Foundry, Hardhat, React, Wagmi, Viem, and Ethers.js, with practical projects spanning decentralised escrow, crowdfunding, staking, and non-custodial asset-management systems. Strong focus on smart-contract security, state-machine design, ERC-20 interactions, access control, reentrancy protection, pull-payment architecture, and comprehensive testing. Seeking to contribute to production Web3 systems while deepening expertise in smart-contract development, protocol architecture, and blockchain security.

TECHNICAL SKILLS

Smart Contracts & Blockchain: Solidity, Ethereum, Smart Contract Architecture, Foundry, Hardhat, ERC-20, Access Control, Reentrancy Protection, Checks-Effects-Interactions, Pull Payments, Escrow Systems, State Machines, Gas Optimization

Web3 Development: Wagmi, Viem, Ethers.js, MetaMask, RainbowKit, Contract Deployment, ABI Integration, Sepolia Testnet

Frontend: React.js, Next.js, TypeScript, JavaScript, Vite, HTML, CSS, Tailwind CSS

Developer Tools: Git, GitHub, Bash, VS Code, Node.js, npm/pnpm, Makefile, Rust (learning)

Security & Testing: Unit Testing, Integration Testing, Edge-Case Testing, Contract Debugging, Balance-Difference Validation, SafeERC20

Geophysics & Technical: Geophysical Surveying, Geological Data Interpretation, Drilling Operations, Geoscience Software

SELECTED SMART CONTRACT & WEB3 PROJECTS

NextKey — Non-Custodial Crypto Inheritance dApp

Personal Project | 2026

- Built a non-custodial Ethereum inheritance protocol enabling users to create vaults, designate beneficiaries, and manage digital assets without surrendering custody.
- Designed a VaultFactory architecture for creating and tracking individual inheritance vaults.
- Implemented configurable check-in intervals, grace periods, claim delays, and time-based state transitions.
- Developed ERC-20 asset management and beneficiary distribution logic using transferFrom.
- Implemented guardian controls to pause inheritance claims and protect vault assets.
- Built a Next.js frontend with Wagmi and RainbowKit for wallet connectivity and smart-contract interaction.
- Deployed smart contracts to the Sepolia testnet using automated deployment scripts.

MyMarket — Decentralised Escrow Marketplace

Personal Project | 2026

- Developed a Solidity-based escrow marketplace supporting both ETH and ERC-20 payments.
- Implemented the complete order lifecycle: creation, funding, shipping, delivery confirmation, refund, and timeout settlement.
- Applied state-based authorisation to prevent invalid order transitions and unauthorised fund movements.
- Implemented pull-payment architecture to reduce reentrancy risk.
- Integrated OpenZeppelin SafeERC20 and balance-delta validation for safer ERC-20 interactions.
- Designed a 7-day timeout mechanism for automated seller settlement when buyers fail to confirm delivery.
- Implemented configurable platform fees using basis points and a designated fee recipient.
- Wrote comprehensive Foundry unit tests covering normal flows, failure conditions, and edge cases.

Crowdfunding dApp — Full-Stack Decentralised Crowdfunding Platform

Personal Project | 2026

- Built a decentralised crowdfunding platform using Solidity, Foundry, React, and Vite.
- Developed smart contracts for campaign creation, ETH contributions, donation tracking, deadlines, and withdrawals.
- Integrated Wagmi, Viem, and Ethers.js for blockchain interactions and transaction handling.
- Built interfaces for campaign discovery, creation, campaign details, donations, and user profiles.

Nexus DeFi Staking dApp — Token Staking Protocol

Personal Project | 2026

- Developed Solidity contracts for ERC-20 token staking, reward accumulation, reward claiming, and withdrawals.

- Implemented time-based reward calculations and user staking positions.
- Built blockchain interaction flows connecting the staking contracts to a TypeScript-based frontend.
- Gained practical experience designing token-based DeFi mechanisms and managing ERC-20 interactions.

CERTIFICATIONS & TRAINING

Blockchain Basics Certification — Cyfrin Updraft

2024 | Online

Advanced Smart Contract Development — Cyfrin Updraft

2024 | Online

- Solidity security patterns, smart contract architecture, gas optimisation, DeFi system design.

Software Engineering — Blockchain Track

Blockfuse Labs | 2024 – Present

- Smart contract development, full-stack Web3 application development, blockchain architecture, and real-world decentralised application design.

EDUCATION

B.Eng. Geophysics — Abubakar Tafawa-Balewa University (ATBU)

2018 – 2024 | Bauchi, Nigeria

ADDITIONAL INFORMATION

Interests: Blockchain infrastructure, smart-contract security, decentralised applications, DeFi, Web3 development
